No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 25, P

Alab_host="E. Coli strain XL10-Gold, T1-resistant, F-"
Alab_host="Vector: PWD42nv; Purified genomic DNA from M.
Musculus GS7BL/63 (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch or liftee at constant velocity. The sheared bNA
was blunt end-repaired with T4 DNA polymerase and T4
polymusleotide kinase. Adaptor oligonaleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 &b range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gil47321141gb[AR129072.1), a copy number
inducible derivative of plasmid R1. Inc vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse LNA was annealed to
adaptored vector DNA, and transformed into

Sequenced from the Brugia malayi BAC library constructed by Claire
Whitton and Dr Mike Quail. The sequence was generated by The
Pathogen Sequencing Unit, The Sanger Institute, Cambridge, UK in
collaboration with Mark Blaxter, ICAPB, University of Edinburgh,
Seq primer: T7 (TAATACGACTCACTATAGGG)

Class: BAC ends.

Male blood DNA was isolated from one randomly chosen donor
and partially digested with a combination of EcoRI and
EcoRI Methylase. Size selected DNA was cloned into the
PBACe3.6 vector at EcoRI sites.

Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT713 vector. Library is normalized. Library was constructed by Bento Scares and M. Fatima Bonaldo.

```

pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
